

Greenstone is a specialist carbon solutions company. We work in partnership with major commercial and public sector organisations to enable them to measure, manage and mitigate their carbon emissions and obligations responsibly.

Greenstone Introduction

Greenstone's solutions comprise both consulting advice and the provision of enterprise carbon management software, Acco₂unt, covering carbon emissions, energy, waste and water consumption through a SaaS (Software as a Service) model. Our central objective is to leave our clients with the necessary tools and knowledge to measure and manage their carbon emissions on an ongoing basis and report against regulatory and voluntary schemes, meet customer requirements and communicate publically. Our engagements with clients follow a three step process: i) Carbon Readiness Assessment; ii) Acco₂unt implementation and iii) Carbon reduction strategy. We continue to provide technical support through phone and email and our consulting team is available for specific problem solving and advice.

Central to Greenstone's proposition is its unique Acco₂unt software which provides organisations with a robust enterprise carbon management and accounting solution. Acco₂unt enables organisations to measure, manage, plan, store and report emissions, consumption and financial data at multiple organisational and geographic levels. An extensive list of emission sources is included in the calculation covering energy, travel and transport, ICT, waste and water.

Greenstone's extensive Co₂e knowledge database applies the latest climate change impact factors according to national and international protocols e.g. GHG, Defra, CRC, Bilan Carbone, etc. Greenstone's team of consultants constantly monitor emerging legislation and changes to methodologies and

reporting regimes to ensure our clients' calculations and reports are compliant with current guidelines and legislation.

Greenstone's consulting team includes a blend of capabilities covering scientific and commercial skills across a wide range of sectors and is accredited by the Carbon Trust in the UK. Acco₂unt is deployed in over 30 major enterprises in more than 70 countries.
